

1 **Table S1.** Models that describe the impacts of size (weight) and maturation (age) on
 2 clearance.

Model description		Formula
Model I	Base model	$CL = CL_{pop} \times \left(\frac{WT}{WT_{median}} \right)^{k_1}$
Model II	Simple exponent model	$CL = CL_{pop} \times \left(\frac{WT}{WT_{median}} \right)^{k_1} \times \left(\frac{Age}{Age_{median}} \right)^{beta1}$
Model III	Sigmoid maturation model	$CL = CL_{pop} \times \left(\frac{WT}{WT_{median}} \right)^{k_1} \times MF$ $MF = \frac{1}{1 + \left(\frac{Age}{MT_{50}} \right)^\gamma}$
Model IV	Age-dependent exponent (ADE) model	$CL = CL_{pop} \times \left(\frac{WT}{WT_{median}} \right)^{k_1}$ $k_1 = k_0 - \frac{k_{max} \times Age^\gamma}{k_{50}^\gamma + Age^\gamma}$
Model V	Body weight-dependent exponent (BDE) model	$CL = CL_{pop} \times \left(\frac{WT}{WT_{median}} \right)^{k_1}$ $k_1 = k_0 - \frac{k_{max} \times WT^\gamma}{k_{50}^\gamma + WT^\gamma}$

3 CL is the typical clearance of a given individual, and CL_{pop} is population typical value of
 4 vancomycin clearance. WT is the weight of a given individual and WT_{median} is median
 5 weight of the population. k_1 is the exponent.

6 Model I: in the base model, the exponent k_1 is fixed to 0.75.

7 Model II: in the simple exponent model, the exponent k_1 is fixed to 0.75. Age (i.e:
 8 gestational age (GA), gestational age (PNA), and Postmenstrual age (PMA)) with
 9 exponential function is tested to explore the effect on vancomycin clearance.

10 Model III: in the sigmoid maturation model, the exponent k_1 is fixed to 0.75. MF represents
 11 the maturation factor (MF) which defines the maturing process. MT_{50} is the value of age
 12 when maturation reaches 50% of the adult clearance, and γ is the Hill coefficient which
 13 controls the slope of sigmoid function.

14 Model IV and V: Age-dependent exponent (ADE) model and body weight-dependent
 15 exponent (BDE) model respectively. k_0 is the value of the exponent at birth (0 years)
 16 (Model IV) or at a theoretical weight of zero (Model V), k_{max} is the maximum decrease of

17 the exponent, k_{50} is the age (Model IV) or weight (Model V) at which a 50 % decrease in
18 the maximum decrease is attained, and γ is the Hill coefficient used to determine the
19 steepness of the sigmoid decline.

20 **Table S2.** Calculation of mean prediction error (MPE) and mean absolute prediction
 21 error (MAPE).

Formula ^a	
Mean prediction error* (MPE)	$MPE (\%) = \frac{1}{N} \sum \frac{IPRED_i - OBS_i}{OBS_i}$
Mean absolute prediction error* (MAPE)	$MAPE (\%) = \frac{1}{N} \sum \left \frac{IPRED_i - OBS_i}{OBS_i} \right $

22 ^aIPRED_i and OBS_i is individual prediction and the observation of the ith subject, and N is
 23 the number of subjects in the data set of the external evaluation.

24 *MPE and MAPE values within the range of 20% and 30% respectively were considered
 25 acceptable for the final model.

26 **Table S3.** Demographic and clinical data for neonates in this study.

Variables	Median (range/proportion)
Maturation	
Gender	102/80 (male/female)
Gestational age (weeks)	30.71 (22.29~41.29)
Postnatal age (weeks)	1.57 (0.14~12.43)
Postmenstrual age (weeks)	33.00 (22.29~44.43)
Birth weight (kg)	1.64 (0.55~4.40)
Current weight (kg)	1.54 (0.55~5.57)
Renal Function	
Serum creatinine ($\mu\text{mol/L}$)	28.45 (3.90~77.50)
Creatinine clearance [(mL/min)/1.73m ²]	33.22 (9.69~142.18)
PK/PD Parameters	
Daily dose (mg/kg)	29.78 (11.41~62.07)
Clearance [L/(h·kg)]	0.06 (0.02~0.16)
Vancomycin trough (mg/L)	10.92 (3.11~51.36)
AUC ₀₋₂₄ (mg·h/L)	361 (191~788)
AUC ₂₄₋₄₈ (mg·h/L)	532 (265~1066)
AUC ₀₋₄₈ (mg·h/L)	898 (456~1854)
Comorbidities	
Patent ductus arteriosus	83 (45.60%)
Pneumonia	78 (42.86%)
Bronchopulmonary dysplasia	43 (23.63%)
Meningitis	37 (20.33%)
Neonatal necrotic enterocolitis	33 (18.13%)
Persistent pulmonary hypertension of newborn	16 (8.79%)
Co-medication	
Meropenem	89 (48.90%)
Vasoactive drugs	39 (21.43%)
Furosemide	30 (16.48%)
Ibuprofen	8 (4.40%)
Outcome	
Mortality	15 (8.24%)

28 **Table S4.** Results of covariate screening and population pharmacokinetic modeling.

Model description ^a	OFV ^b	AIC ^c	BIC ^d	V _{pop} (RSE%) ^e	CL _{pop} (RSE%) ^f	V(CV%) (RSE%) ^g	CL(CV%) (RSE%) ^h	Shrinkage_ V(%) ⁱ	Shrinkage _CL(%)	b (RSE%) ^j

Step 3: VAS										
PMA, SCR, VAS on CL	2484	2499	2525	0.86 (3.02)	0.09 (2.11)	11% (24.20)	24% (6.85)	-4.72	1.67	0.21 (5.01)

29 ^a**Bold font represents the selected models in each step;**

30 ^bOFV, objective function value;

31 ^cAIC, Akaike information criteria;

32 ^dBIC, Bayesian information criteria;

33 ^eV_{pop}, population typical value of volume of distribution;

34 ^fCL_{pop}, population typical value of clearance.

35 ^gV (CV%), interindividual variability of volume of distribution.

36 ^hCL (CV%), standard deviation of the random effects of clearance.

37 ⁱIn Monolix, shrinkage of each PK parameter is calculated from the empirical variance of the random effects var(η_i) and the estimated
38 variance ω^2 (Equation S1). Instead of using the shrunk conditional empirical bayes estimates (EBEs) or conditional mean, Monolix uses
39 parameter values randomly sampled from the conditional distribution to circumvent shrinkage.

40
$$\text{shrinkage} = 1 - \frac{\text{var}(\eta_i)}{\omega^2} \quad (\text{S1})$$

41 ^jb, residual error parameter.

42 **Table S5.** Results of final model and external evaluation.

Parameter ^a	Original data set		New data set ^c	
	Value	RSE (%) ^b	Value	RSE (%)
Structure model parameter				
V _{pop} (L)	0.86	3.02	0.86	3.85
CL _{pop} (L/h)	0.09	2.11	0.09	2.10
beta1	2.35	1.20	2.40	3.03
beta2	0.18	3.41	0.22	2.86
F _{VAS}	0.86	0.34	0.86	0.30
Inter-individual variability				
V (%CV)	11.20%	24.20	14.60%	21.40
CL (%CV)	23.70%	6.85	23.00%	6.79
Residual variability				
Proportional (%CV)	21.40%	4.82	21.40%	5.04

43 ^aV_{pop}, population mean estimate for volume of distribution in a subject with a body weight
 44 of 1.5 kg; cWT, current body weight; CL_{pop}, population mean estimate for vancomycin
 45 clearance in a subject with a body weight of 1.5 kg; PMA, postmenstrual age; SCR, serum
 46 creatinine; F_{VAS}, scaling factor of concomitant use of vasoactive drugs; V (%CV),
 47 interindividual variability of volume of distribution; CL (%CV), interindividual variability
 48 of vancomycin clearance.

49 ^bRSE, relative standard error.

50 ^cA new data set combines original data set and the data set of external validation.

51 **Table S6.** Predictive matrices of classification and regression tree (CART) derived and
 52 other candidate AUCs in predicting AKI.

AUC(mg·h/L)	Sensitivity(%)	Specificity(%)	PPV ^a (%)	NPV ^b (%)	AUC _{ROC} ^c (95%CI)
