SI Materials.

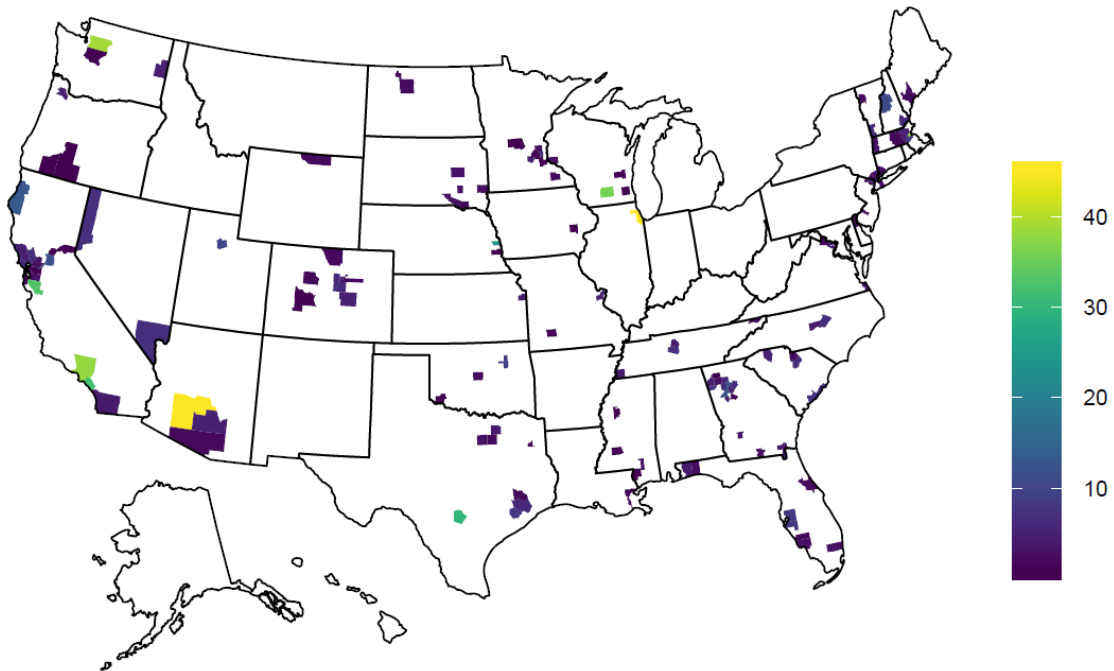

Figure S1. Number of days that passed from the time of the first case to the date of the emergency declaration. Areas in white were under emergency declaration before they experienced their first COVID-19 case.

Table S1: Summary of regression results specification (without national case interaction with the first county report). The specifications are (1) models with cumulative county cases, (2) models with cumulative state rather than county cases, (3) models with cumulative state and county cases, (4) models with new county cases rather than cumulative cases, (5) models with new state cases rather than cumulative cases, (6) models with new county and state cases rather than cumulative cases, (7) models with cumulative county deaths, (8) models with cumulative state rather than county deaths, and (9) models with cumulative state and county deaths. Model (a) is the basic county fixed effects model with no time fixed effects, (b) add fixed effects relative to the first case in the county, and (c) add fixed effects relative to the date of the stay-at-home order.

models without national interaction	county case	state case	stay-home	school-closure	county interaction	state interaction	county crowd out %	state crowd out %
1-a	0.0591***		0.201***	0.145***	-0.0336***		56.9%

Table S12: Models with cumulative cases, new cases, and death reports together. While the main effect of county cases, stay-at-home orders, and their interaction are stable and consistent with the primary specifications, the main effects and interaction with the stay-at-home order for new case and death variables are not. This suggests insufficient variation among cumulative cases, new cases, and death to include them all in the model simultaneously.
