nCases_maxNPI: number of reported cases at the time of the maximum non-pharmaceutical intervention (NPI).

CESTtoNPI: number of days between the central epidemic seeding time (CEST) and the maximum non-pharmaceutical intervention (NPI).

popSize: census population size for the site under study.

case10toNPI: number of days between the tenth reported case and the maximum non-pharmaceutical intervention (NPI).

Ne: viral effective population size at the time of the maximum non-pharmaceutical intervention (inferred using skygrowth model).

R0: basic reproduction number, inferred either in an SEIJR model (in regression model 16) or using skygrowth (in regressions model 8).

Deaths: number of deaths one month after the maximum non-pharmaceutical intervention.

EstimatedI: number of estimated infections at the time of the maximum non-pharmaceutical intervention, inferred in an SEIJR model.

Supplementary Table 2 | Sites included and excluded from the analyses and results from the skygrowth analysis

Site analysed	World region	Number of sequences	Date of max NPI	Reported cases at max NPI	max NPI info	Deaths 1 month after max NPI	Population size	Date of tenth case	BEAST site	Skygrowth site	CEST	Ne	Skygrowth R0	reasons for inclusion/exclusion	Source of data

Note: Data and sources of data are shown for all 57 sites included in the skygrowth analysis. The BEAST site and Skygrowth site column indicate whether or not that site was included in each set of analyses. CEST- Central epidemic seeding time (see Methods). Ne - Viral effective population size

Supplementary Table 3 | Results from the BEAST analysis and mobility correlation analysis for 30 sites.

Site analysed	BEAST R0	Estimated infections at max NPI	Sample Proportion at max NPI	Mobility correlation (r)	p-value
Abruzzo, Italy	1.64	29.6	0	0.541	1.16E-05

Note: R_0 and the number of infections at the time of the maximum non-pharmaceutical intervention (max NPI) were inferred in an SEIJR model using BEAST. Sample proportion was calculated at max NPI as the number of reported infections divided by the number of estimated infections. The Pearson's correlation coefficient and its p-value were calculated from the reproductive number over time R_t and changes in mobility, as provided by Google.
